SECURITY INCIDENT INVESTIGATION REPORT BY ROHI INTL GUARDS LTD

Facility: **ILORIN INNOVATION HUB**

Incident: Theft of Underground Armoured Cables

Date of Occurrence: 26th January, 2026

Date Notified: 29th January, 2026

Time Notified: Approximately 21:17hrs

Date of Report: 2nd/March/2026

Prepared By: **OLOBAYO, LALEYE. O**

1. INTRODUCTION

This report presents the outcome of an internal investigation conducted following the theft of underground armoured cables at the above-mentioned facility under the security coverage of Rohi Intl Guards Ltd.

The purpose of this report is to clearly outline the scope of investigation, findings, root cause analysis, actions taken, and recommendations aimed at preventing recurrence.

2. INCIDENT SUMMARY

The theft involved underground armoured cables installed beneath the surface level and covered with granite material within the facility premises. Due to the concealed and subsurface nature of the installation, the removal of the cables was not immediately visible or easily detectable through routine surface patrol observation.

The occurrence is reported to have taken place on **26th January, 2026

Rohi Intl Guards Ltd management was formally informed of the incident on 29th January, 2026 at approximately 21:15hrs. Upon receiving notification, I immediately proceeded to the facility to conduct an on-site assessment and initiate internal review procedures.

Video documentation relating to the discovery was recorded using a personal mobile device and has been securely preserved.

3. SCOPE OF INVESTIGATION

The internal investigation covered the following:

- * Review of the circumstances surrounding the theft.
- * Identification of guards deployed during the relevant shift period.

- * Cooperation with the Nigeria Security and Civil Defence Corps during formal interrogation.
- * Assessment of patrol compliance, supervision structure, and post coverage.
- * Evaluation of surveillance system functionality.
- * Preservation and documentation of available evidence.

4. FINDINGS

The investigation established the following:

1. The stolen cables were underground installations covered with granite, significantly limiting immediate visual detection.
2. Surface-level patrol methods did not reveal clear or obvious tamper indicators at the time of occurrence.
3. Operational lapses were identified in patrol discipline and monitoring.
4. Supervisory oversight during the affected shift required strengthening.
5. External surveillance systems were not fully functional, limiting technological support in the affected area.
6. Coordination between physical patrol and technological monitoring was insufficient.

At this stage, there is no confirmed evidence of internal conspiracy; however, procedural weaknesses and negligence factors were identified.

5. ROOT CAUSE ANALYSIS

The root causes identified include:

- * Concealed underground infrastructure without dedicated monitoring measures.
- * Absence or inactivity of external CCTV coverage in critical areas.
- * Patrol protocols not specifically structured to monitor underground asset vulnerabilities.
- * Supervisory enforcement gaps during the relevant period.
- * Need for enhanced refresher training on risk identification and proactive detection techniques.

The subsurface positioning of the cables and granite covering contributed to delayed discovery.

6. ACTIONS TAKEN

The following corrective measures have been implemented:

- * Replacement of all morning shift guards deployed during the relevant period.
- * Strengthening of supervision and reporting lines.

- * Reinforcement of patrol accountability and procedures.
- * Initiation of retraining programs on modern security awareness, vigilance, and asset protection.
- * Secure preservation of video evidence.
- * Ongoing cooperation with authorities to facilitate arrest and prosecution of the suspect, who remains at large.

7. RECOMMENDATIONS TO PREVENT RECURRENCE

To enhance protection of underground and surface assets, the following are recommended:

1. Immediate activation and maintenance of all external CCTV systems.
2. Installation of modern surveillance systems with:
 - * 360° coverage
 - * Continuous recording capability
 - * Motion detection features
 - * Secure storage backup
3. Implementation of patrol check protocols specifically for underground infrastructure zones.
4. Periodic inspection of concealed installations for signs of disturbance.
5. Integration of surveillance monitoring with patrol routing strategy.
6. Quarterly refresher training on infrastructure protection and risk awareness.
7. Regular joint security review meetings with management.

8. CONCLUSION

The theft of underground armoured cables is deeply regretted. The incident has been thoroughly reviewed and structured corrective measures have been implemented to strengthen operational standards.

ROHI INTL GUARDS LTD remains fully committed to transparency, accountability, and continuous improvement to ensure enhanced protection of the facility and its users.
